

Boiler Installations, Servicing & Repairs

INSTALLS

From a simple combination boiler exchange to a full multi-zone central heating & hot water system, combined with renewable energy products and underfloor heating, we can customise the installation to meet your needs and household demands.

We can offer advice and guidance where required, to help you select the most suitable product that ensures your objectives are met, considering what you need and expect from the new installation.

Care is taken to ensure you are kept fully apprised of progress during the works and as far as is reasonably possible we try to leave you with some form of heating and hot water. On completion we will check that you are completely satisfied with the new installation and understand how it all works.

SERVICING

A boiler service is one of the most important ways to ensure your boiler remains working to full capacity, whilst maximising the efficiency and lifetime expectancy and providing energy savings reducing your bills.

Our boiler services consist of stripping the boiler down where applicable, vacuuming and cleaning the interior of the boiler, checking of all controls to ensure they are fully operational and advising of any defects found. A visual inspection is made to all radiators for any signs of leaks or rust, in addition to checking for air blockages that reduces the heat output.

REPAIRS

We aim to fix all breakdowns whilst on site where possible, however where parts are required, we will endeavor to repair the boiler within the next working day.

Working with one of the largest suppliers of boiler parts, they can usually be sourced and delivered by the next working day. (Providing the order is placed before 3pm and the item is in stock within the warehouse)
