

## ***UNVENTED CYLINDERS***

An unvented cylinder is a pressurised hot water system. This style of cylinder removes the need for any additional pumps for showers as it provides equal pressures throughout the property to hot and cold-water taps, regardless of how many outlets are simultaneously in operation.

It is currently one of the best-insulated cylinders on the market, thus providing energy savings.

With these systems it is also possible to add a secondary hot water return that provides you with instantaneous hot water to any part of the house.

NOTE: This may not be possible in some properties due to the location of the cylinder.
